Executive conclusion

“Keep the delivery record separate from the provider request. A successful response and a durably recorded outcome answer different questions.”

This neutral example demonstrates the visual treatment for a technical report. Its scenario is illustrative. Replace it with sourced evidence, explicit unknowns and the actual next action when writing a report.

Use serif text for the explanation and table bodies. Let the template supply heading hierarchy, spacing, margins and page furniture. Do not shrink the body to turn a report into a compact dashboard.

Question	Meaning	Next action
Was the request accepted?	Transport result	Record the response.
Was the result retained?	Durable state	Verify the stored outcome.
Can the request be retried?	Recovery policy	Handle uncertainty explicitly.

Explain the flow

A diagram shows ownership and order. Nearby prose carries qualifications that would otherwise crowd its labels.

Figure 1: Illustrative delivery flow. This is a visual reference, not a claim about a deployed system.

Keep technical text native

A call tree is text, not an architecture drawing:

```
submitDelivery
  authorizeRecipient
  recordAttempt
  callProvider
  recordOutcome
```

text

An algorithm uses procedural notation:

```
1 load the delivery record
2 if its outcome is already known then
3   | return the recorded outcome
4 else
5   | apply the approved recovery policy
6 end
```

Finish with a specific action

A real report names the responsible role, the change, the expected result and important uncertainty. It cites claims near their evidence and includes a bibliography when citations are used. This example has no source evidence and must not be presented as a completed investigation.
